

Based on the preponderance of evidence, experience, and immutable laws of physics, it's clear to me and many many others that broadband over power lines will kill HF amateur radio. I have enjoyed the hobby for many years and hoped to continue doing so, but should you allow this proposal to become a reality, I expect to put my radio hobby away permanently. I urge you to please stop the meddling that's currently being done with the spectrum and technology. Broadband over cable is the logical best method that offers the least interference to others. I realize we hams are but three-quarters of a million or so, compared to the many millions of non-hams that might use the service, and of course money talks, but please give us credit for the hours we've devoted to emergency and public service in our community, states and nation. We've earned the right to ask you not to even consider something that promises the death of HF amateur radio. Please don't ruin the hobby for me and the rest?
